```

EDA

First, let's focus on the lines of code that have functional content in them, which would exclude blank and comment lines. This can control for the style of coding that each creator has—i.e. how much commenting (or lack thereof) they do. This variable will be stored as `code_lines_[directory]` = `loc_lines_[directory]` - (`blank_lines_[directory]` + `comment_lines_[directory]`) for each of the five directories present: `/R` as `_R`, `/src` as `_src`, `/inst/include` as `_inst`, `/vignettes` as `_vignettes`, and `/tests` as `_tests`.
